Chapter 1

Namespace Index

1.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

src::parsing::map_parser	9
--	---

Chapter 2

Class Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

src.path.Archi	11
src.world.BaseObject	12
src.world.ClientObject	22
src.world.ServerObject	45
BDock	13
BDocksZone	14
BDockWidget	15
CellDock	18
CellTypesDock	20
MapDock	27
BHandler	16
BinaryStateMachine	16
BLayout	17
src.world.Cell	18
CellTypeListModel	19
src.client.CellViewer	20
CICoords	21
src.client.Client	21
Editor	22
src.world.Entity	22
Game	23
src.interactions.Interaction	24
Intertie	25
src.world.Map	26
MapPainter	27
MapsEditor	33
MapsListModel	34
MapView	35
src.client.MapViewer	35

src.network.NetworkClient	36
src.networkudp.NetworkClient	36
src.network.NetworkServer	37
src.networkudp.NetworkServer	37
NewGame	38
Object	38
Cell	17
CellType	19
Image	23
Map	25
World	47
src.world.ObjectType	40
Options	40
src.orders.Order	41
src.orders.OrderDispatcher	41
src.utils.Perf	42
PtCoords	43
PxCoords	43
RlCoords	44
src.server.Server	44
src.network.ServerConnection	45
TabAcces	46
TabBar	46
Welcome	46
src.world.World	47
WorldEditor	48
XmlHandler	48

Chapter 3

Class Index

3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

src.path.Archi	11
src.world.BaseObject	12
BDock	13
BDocksZone	14
BDockWidget	
Base class for game-related docks	15
BHandler	16
BinaryStateMachine	
Simple QStateMachine with two states	16
BLayout	17
Cell	17
src.world.Cell	18
CellDock	18
CellType	19
CellTypeListModel	19
CellTypesDock	20
src.client.CellViewer	20
CICoords	
Describe positions with cell coordinates	21
src.client.Client	21
src.world.ClientObject	22
Editor	
Main window of the Editor	22
src.world.Entity	22
Game	
Gather the different parts needed to describe a game	23
Image	
Stores an external file in a QImage, and gives each image resources a unique identifier	23

src.interactions.Interaction	24
Intertie	
Provide int that move smoothly from their value to an objective	25
Map	25
src.world.Map	26
MapDock	27
MapPainter	
That can paint a Map using a QPainter	27
MapsEditor	
Tab offering map editing facilities	33
MapsListModel	
Presentation class for the Qt Model-View framework	34
MapView	
Widget to display and edit a Map using a MapPainter	35
src.client.MapViewer	35
src.network.NetworkClient	36
src.networkudp.NetworkClient	36
src.network.NetworkServer	37
src.networkudp.NetworkServer	37
NewGame	38
Object	
Base class for every part of games	38
src.world.ObjectType	40
Options	
Classe singleton encapsulant la gestion des options permanentes	40
src.orders.Order	41
src.orders.OrderDispatcher	41
src.utils.Perf	42
PtCoords	
Describe positions with virtual point coordinates	43
PxCoords	
Describe positions with real pixel coordinates	43
RlCoords	
Describe positions with relative coordinates	44
src.server.Server	44
src.network.ServerConnection	45
src.world.ServerObject	45
TabAcces	46
TabBar	46
Welcome	46
src.world.World	47
World	
Object	47
WorldEditor	48
XmlHandler	48

Chapter 4

File Index

4.1 File List

Here is a list of all documented files with brief descriptions:

src/editor/Game/ game.h	??
src/editor/Game/ map.h	??
src/editor/Game/ mappainter.h	
Definition of the class used to render maps	49
src/editor/Game/ mapslistmodel.h	??
src/editor/Game/ object.h	
This header defines the base class Object and Image	50
src/editor/Game/ xmlhandler.h	??
src/editor/GUI/ editor.h	??
src/editor/GUI/ newgame.h	??
src/editor/GUI/ options.h	??
src/editor/GUI/ tabacces.h	??
src/editor/GUI/ tabbar.h	??

src/editor/GUI/Tabs/Docks/ bdockszone.h	??
src/editor/GUI/Tabs/Docks/ bdockwidget.h	??
src/editor/GUI/Tabs/Docks/ intertie.h	??

Chapter 5

Namespace Documentation

5.1 `src::parsing::map_parser` Namespace Reference

Functions

- def [parse_cell](#)
- def [map_parser](#)
- def [get_size](#)
- def **gen_map**

5.1.1 Detailed Description

This module handles xml parsing for maps description files.

5.1.2 Function Documentation

5.1.2.1 `def src.parsing.map_parser.get_size (tree)`

Gets the size of the map.

5.1.2.2 `def src.parsing.map_parser.map_parser (map_xml)`

The main parser for the map xml file.

5.1.2.3 `def src.parsing.map_parser.parse_cell (cell_object)`

Parses a CellType attribute.

Chapter 6

Class Documentation

6.1 src.path.Archi Class Reference

Public Member Functions

- def `__init__`
- def `get_src_file`
- def `get_static_file`
- def `get_xml_file`
- def `list_files`
- def `get_src_dir`
- def `get_static_dir`
- def `get_xml_dir`

Public Attributes

- `main_directory`

6.1.1 Detailed Description

This class manages the architecture of the project.
It allows the user to travel in the file system of the game, to get the XML files and others (PNG, configuration files...)
Moreover, it should be cross-platform compliant

6.1.2 Member Function Documentation

6.1.2.1 `def src.path.Archi.get_src_dir (self, dir_path)`

Gets the given `dir_path` with respect to the `src` folder.

6.1.2.2 `def src.path.Archi.get_src_file(self, file_path, mode = 'r')`

Gets the path of the src directory.
At least used by the src scripts.

6.1.2.3 `def src.path.Archi.get_static_dir(self, dir_path)`

Gets the given `dir_path` with respect to the static folder.

6.1.2.4 `def src.path.Archi.get_static_file(self, file_path, mode = 'r')`

Gets the path of the static files directory. Static files are basically all graphical files, and a description of the common world

6.1.2.5 `def src.path.Archi.get_xml_dir(self, dir_path)`

Gets the given `dir_path` with respect to the xml folder.

6.1.2.6 `def src.path.Archi.get_xml_file(self, file_path, mode = 'r')`

Gets the path of a xml file describing a world, a scenario, or a campaign.

6.1.2.7 `def src.path.Archi.list_files(self, dir_path)`

List all the files present in the `dir_path`, if it is a dir.
Else raise a `FileNotFoundError`.

The documentation for this class was generated from the following file:

- `src/path.py`

6.2 `src.world.BaseObject` Class Reference

Inheritance diagram for `src.world.BaseObject`:

Public Member Functions

- def **__init__**
- def **__getattr__**
- def **load**
- def **contextEval**

Public Attributes

- **ident**
- **params**

Static Public Attributes

- int **ident** = 0
- dictionary **ids** = {}

The documentation for this class was generated from the following file:

- src/world.py

6.3 BDock Class Reference

Public Slots

- void **setTitle** (QString s)

Public Member Functions

- **BDock** (QString title, [BDockWidget](#) *dock, QWidget *parent=0)
- bool **unfold** () const
- void **setUnfold** (bool v)
- int **currentSize** () const
- void **setCurrentSize** (int t)

Properties

- bool **unfold**
- int **currentSize**

The documentation for this class was generated from the following files:

- src/editor/GUI/Tabs/Docks/bdock.h
- src/editor/GUI/Tabs/Docks/bdock.cpp

6.4 BDocksZone Class Reference

Public Types

- enum [ScrollBarMode](#) { [AlwaysVisible](#), [Adaptative](#), [Fixed](#) }

The ScrollBarMode enum describe the way the [BDocksZone](#) reacts when a scroll bar is needed.

Public Slots

- void **swap** (bool anim=true)

Public Member Functions

- **BDocksZone** (QWidget *parent=0)
- void **setUnfold** (bool u, bool anim=true)
- const [BinaryStateMachine](#) * **states** () const
- int **length** () const
- void **setLength** (int t)
- [ScrollBarMode](#) **scrollBarMode** () const
- void **setScrollBarMode** ([ScrollBarMode](#) m)
- int **currentLength** () const
- void **addDock** (QString title, [BDockWidget](#) *dock)

Protected Slots

- void **setCurrentLenght** (int t)

Properties

- int **length**
- int **currentLength**

6.4.1 Member Enumeration Documentation

6.4.1.1 enum BDocksZone::ScrollBarMode

The ScrollBarMode enum describe the way the [BDocksZone](#) reacts when a scroll bar is needed.

Enumerator:

AlwaysVisible Always show the scroll bar, even if it is useless

Adaptative Show the scroll bar when needed, adaptating the docks length

Fixed Show the scroll bar when needed, keeping the docks length fixed

The documentation for this class was generated from the following files:

- src/editor/GUI/Tabs/Docks/bdockszone.h
- src/editor/GUI/Tabs/Docks/bdockszone.cpp

6.5 BDockWidget Class Reference

The [BDockWidget](#) class is the base class for game-related docks.

```
#include <bdockwidget.h>
```

Inheritance diagram for BDockWidget:

Public Slots

- virtual void **updateGame** ()

Signals

- void **gameModified** ()
- void **changeDockName** (QString)

Public Member Functions

- **BDockWidget** (QWidget *parent=0)
- void **setGame** ([Game](#) *g)

Protected Attributes

- [Game](#) * **game**

6.5.1 Detailed Description

The [BDockWidget](#) class is the base class for game-related docks.

It provides common functions for set game, update, ...

The documentation for this class was generated from the following files:

- src/editor/GUI/Tabs/Docks/bdockwidget.h
- src/editor/GUI/Tabs/Docks/bdockwidget.cpp

6.6 BHandler Class Reference

Public Member Functions

- bool **startElement** (const QString &namespaceURI, const QString &localName, const QString &qName, const QDomAttributes &atts)
- bool **endElement** (const QString &namespaceURI, const QString &localName, const QString &qName)

The documentation for this class was generated from the following file:

- src/editor/GUI/editor.h

6.7 BinaryStateMachine Class Reference

The [BinaryStateMachine](#) class is a simple QStateMachine with two states.

```
#include <intertie.h>
```

Public Slots

- void **swap** ()
- void **setPositive** (bool p)
- void **setNegative** (bool n)

Signals

- void **swapped** (bool)
- void **__swap** ()

Public Member Functions

- **BinaryStateMachine** (QObject *parent=0)
- void **defineProperty** (QObject *obj, const char *prop)
- void **defineProperty** (QObject *obj, const char *prop, QVariant yesValue, QVariant noValue)
- bool **isPositive** () const
- bool **isNegative** () const

6.7.1 Detailed Description

The [BinaryStateMachine](#) class is a simple QStateMachine with two states.

The documentation for this class was generated from the following files:

- `src/editor/GUI/Tabs/Docks/intertie.h`
- `src/editor/GUI/Tabs/Docks/intertie.cpp`

6.8 BLayout Class Reference

Signals

- void **sizeChanged** (int)

Public Member Functions

- **BLayout** (QWidget *parent=0)
- void **setOrientation** (Qt::Orientation o)
- void **insert** ([BDock](#) *d, int ind=-1)
- void **setSpacing** (int e)
- void **setLength** (int t)
- int **spacing** () const

The documentation for this class was generated from the following files:

- `src/editor/GUI/Tabs/Docks/bdockszone.h`
- `src/editor/GUI/Tabs/Docks/bdockszone.cpp`

6.9 Cell Class Reference

Inheritance diagram for Cell:

Public Member Functions

- **Cell** ([Game](#) *g=nullptr)
- bool **isSelected** () const

- void **setSelected** (bool s=true)
- void **invertSelected** ()
- **ParamObj** (cellType, [CellType](#), c) [ObjectsMap](#)(c)

Public Attributes

- **o**
- **O**
- **bject**

The documentation for this class was generated from the following files:

- src/editor/Game/map.h
- src/editor/Game/map.cpp

6.10 src.world.Cell Class Reference

Public Member Functions

- def **__init__**

Public Attributes

- **entities**
- **objects**

The documentation for this class was generated from the following file:

- src/world.py

6.11 CellDock Class Reference

Inheritance diagram for CellDock:

Public Slots

- void **updateGame** ()
- void **selectionChanged** ()

Public Member Functions

- **CellDock** (QWidget *parent=0)

The documentation for this class was generated from the following files:

- src/editor/GUI/Tabs/celldock.h
- src/editor/GUI/Tabs/celldock.cpp

6.12 CellType Class Reference

Inheritance diagram for CellType:

Public Member Functions

- **CellType** (Game *g)

The documentation for this class was generated from the following files:

- src/editor/Game/map.h
- src/editor/Game/map.cpp

6.13 CellTypeListModel Class Reference

Public Member Functions

- **CellTypeListModel** (World *w, QObject *parent=0)
- int **rowCount** (const QModelIndex &parent) const Q_DECL_OVERRIDE
- QVariant **data** (const QModelIndex &index, int role) const Q_DECL_OVERRIDE
- bool **insertRows** (int row, int count, const QModelIndex &parent) Q_DECL_OVERRIDE

- bool **removeRows** (int row, int count, const QModelIndex &parent) Q_DECL_OVERRIDE

The documentation for this class was generated from the following files:

- src/editor/Game/mapslistmodel.h
- src/editor/Game/mapslistmodel.cpp

6.14 CellTypesDock Class Reference

Inheritance diagram for CellTypesDock:

Public Member Functions

- **CellTypesDock** (QWidget *parent=0)
- void **updateGame** ()

The documentation for this class was generated from the following files:

- src/editor/GUI/Tabs/celltypesdock.h
- src/editor/GUI/Tabs/celltypesdock.cpp

6.15 src.client.CellViewer Class Reference

Public Member Functions

- def **__init__**
- def **display**

Public Attributes

- **cell**

The documentation for this class was generated from the following file:

- src/client.py

6.16 CCoords Class Reference

The [CCoords](#) class describe positions with cell coordinates.

```
#include <mappainter.h>
```

Public Member Functions

- **CCoords** (qreal x, qreal y)
- **CCoords** (const QPointF &p)

6.16.1 Detailed Description

The [CCoords](#) class describe positions with cell coordinates.

Theses coordinates describe each point relatively to the cell grid. They correspond to the isometric 3D world.

See also [RCoords](#), [PtCoords](#) and [PxCoords](#)

The documentation for this class was generated from the following file:

- src/editor/Game/[mappainter.h](#)

6.17 src.client.Client Class Reference

Public Member Functions

- def **__init__**
- def **__del__**
- def **run**
- def **handleOrder**

Public Attributes

- **net**
- **world**
- **win**
- **mv**
- **interactions**
- **perso**
- **orderDispatcher**
- **lastUpdate**

The documentation for this class was generated from the following file:

- src/client.py

6.18 src.world.ClientObject Class Reference

Inheritance diagram for src.world.ClientObject:

The documentation for this class was generated from the following file:

- src/world.py

6.19 Editor Class Reference

The [Editor](#) class is the main window of the [Editor](#).

```
#include <editor.h>
```

Public Member Functions

- **Editor** (QStringList args, QWidget *parent=0)

6.19.1 Detailed Description

The [Editor](#) class is the main window of the [Editor](#).

It is composed of tabs that offer editing facilities.

The documentation for this class was generated from the following files:

- src/editor/GUI/editor.h
- src/editor/GUI/editor.cpp

6.20 src.world.Entity Class Reference

Public Member Functions

- def `__init__`

Public Attributes

- **quests**
- **inventory**

The documentation for this class was generated from the following file:

- src/world.py

6.21 Game Class Reference

The [Game](#) class gather the differents parts needed to describe a game.

```
#include <game.h>
```

Public Member Functions

- int **newIdent** ()
- [World](#) * **world** ()
- [Map](#) * **currentMap** ()
- void **setCurrentMap** ([Map](#) *m)
- void **addImage** ([Image](#) *im)

6.21.1 Detailed Description

The [Game](#) class gather the differents parts needed to describe a game.

It contains mainly the [World](#), and the ressources used by it (images and strings)

For editing purposes, it contains also the active map (the one being editing)

The documentation for this class was generated from the following files:

- src/editor/Game/game.h
- src/editor/Game/game.cpp

6.22 Image Class Reference

The [Image](#) class stores an external file in a QImage, and gives each image ressources a unique identifier.

```
#include <object.h>
```

Inheritance diagram for Image:

Public Member Functions

- **Image** ([Game](#) *g, const QString &fileName)
- bool [isValid](#) () const
- const QImage & **image** () const
- const QSize **size** () const

6.22.1 Detailed Description

The [Image](#) class stores an external file in a QImage, and gives each image resources a unique identifier.

6.22.2 Member Function Documentation

6.22.2.1 bool Image::isValid () const [inline, virtual]

return true if the object has been initialised

Reimplemented from [Object](#).

The documentation for this class was generated from the following files:

- src/editor/Game/[object.h](#)
- src/editor/Game/object.cpp

6.23 src.interactions.Interaction Class Reference

Public Member Functions

- def **__init__**
- def **load**

Public Attributes

- **target**
- **type**
- **key**
- **event**

The documentation for this class was generated from the following file:

- src/interactions.py

6.24 Intertie Class Reference

The [Intertie](#) class provide int that move smoothly from their value to an objective.

```
#include <intertie.h>
```

Public Slots

- void **setValue** (int v, bool inert=true)
- void **setMaximumSpeed** (int vM)
- void **setAcceleration** (int a)
- void **setUpdateInterval** (int d)

Signals

- void **modificationFinished** (int)
- void **valueChanged** (int)

Public Member Functions

- **Intertie** (QObject *parent=0)
- int **value** () const
- void **link** (QObject *obj, const char *prop)

6.24.1 Detailed Description

The [Intertie](#) class provide int that move smoothly from their value to an objective.

The documentation for this class was generated from the following files:

- src/editor/GUI/Tabs/Docks/intertie.h
- src/editor/GUI/Tabs/Docks/intertie.cpp

6.25 Map Class Reference

Inheritance diagram for Map:

Public Member Functions

- **Map** ([Game](#) *g=nullptr)
- **Getter** (width) Getter(height) QSize size() const
- void **setWidth** (int w)
- void **setHeight** (int h)
- void **resize** (int w, int h)
- **Param** (angleX, AngleX) Param(angleY
- AngleY [Cell](#) & **cell** (int i, int j) const
- [Cell](#) & **cell** (const QPoint &p) const

The documentation for this class was generated from the following files:

- src/editor/Game/map.h
- src/editor/Game/map.cpp

6.26 src.world.Map Class Reference

Public Member Functions

- def **__init__**
- def [fill](#)

Public Attributes

- **cells**
- **cellsGrid**

6.26.1 Member Function Documentation

6.26.1.1 def src.world.Map.fill (self)

Complète les cases par défaut

The documentation for this class was generated from the following file:

- src/world.py

6.27 MapDock Class Reference

Inheritance diagram for MapDock:

Public Member Functions

- **MapDock** (QWidget *parent=0)
- void **updateGame** ()

The documentation for this class was generated from the following files:

- src/editor/GUI/Tabs/mapdock.h
- src/editor/GUI/Tabs/mapdock.cpp

6.28 MapPainter Class Reference

The [MapPainter](#) class that can paint a [Map](#) using a QPainter.

```
#include <mappainter.h>
```

Public Types

- enum [Element](#) { [Nothing](#) = 0, [CellBackground](#) = 1, [Grid](#) = 2, [CellSelection](#) = 4, [CellHighlighting](#) = 8, [Objects](#) = 16, [All](#) = 31 }

The Element enum describes the different elements that can be render.

Signals

- void [mapSizeChanged](#) (QSize)
- void [viewCenterChanged](#) (QPoint)

Public Member Functions

- [MapPainter](#) (QObject *parent=0)
- [MapPainter](#) ([Map](#) *m, QObject *parent=0)
- void [setPaintedElement](#) ([Element](#) e, bool painted=true)
- void [setPaintedElements](#) ([Element](#) e)

- void [setMap](#) ([Map](#) *m)
- void [paint](#) (QPainter &p)
- const QImage & [render](#) ()
- [RICoords](#) [viewCenter](#) () const
- void [setViewCenter](#) ([RICoords](#) relativeCenter)
- void [setViewCenter](#) (double relativeCenterX, double relativeCenterY)
- void [setViewCenterQuiet](#) (double x, double y)
- double [scale](#) () const
- void [setScale](#) (double [scale](#))
- void [setScaleDomain](#) (double scaleMin, double scaleMax)
- bool [setHighlightedCell](#) (const [CICoords](#) &p)
- bool [setHighlightedCell](#) (int i, int j)
- QPoint [highlightedCell](#) () const
- bool [hasHighlightedCell](#) () const
- void [resize](#) (QSize s)
- void [resize](#) (int wi, int he)
- QSize [size](#) () const
- void [zoom](#) (double factor, QPointF fixedPoint)
- QPair< bool, bool > [move](#) ([PxCoords](#) delta, QPointF center)
- QSize [virtualSize](#) () const
- [PxCoords](#) [ptToPxl](#) ([PtCoords](#) p) const
- [PtCoords](#) [pxlToPt](#) ([PxCoords](#) p) const
- [PtCoords](#) [cooToPt](#) ([CICoords](#) p) const
- [CICoords](#) [ptToCoo](#) ([PtCoords](#) p) const
- [PxCoords](#) [cooToPxl](#) ([CICoords](#) p) const
- [CICoords](#) [pxlToCoo](#) ([PxCoords](#) p) const
- [PtCoords](#) [indToPt](#) (int i, int j) const

6.28.1 Detailed Description

The [MapPainter](#) class that can paint a [Map](#) using a QPainter.

The class take charge of the different ratios of the [map](#) rendering and the area in which it will be rendered.

Note

The view is kept updated with the associated [map](#) at each [paint](#) or [render](#) call. It is thus just needed to call one of these functions to update the view after a modification.

To ensure a type checking security about the different types of coordinates that are used, four different types that inherit from QPointF are used : [RICoords](#), [CICoords](#), [PtCoords](#) and [PxCoords](#)

6.28.2 Member Enumeration Documentation

6.28.2.1 enum MapPainter::Element

The Element enum describes the different elements that can be render.

This includes both map's objects and user interaction and editing elements.

Element value can be used as flags using the operators operator| "|", operator| "&", operator| "^".

See also [Cell](#), [CellType](#)

Enumerator:

Nothing Represent no elements

CellBackground The background associated to the [cell type](#)

Grid A thin grid that separate [cells](#)

CellSelection Graphical information about the selection state

CellHighlighting Graphical visualisation of the [cells](#) the mouse is over

Objects The objects that lay on the [cells](#)

All Represent all elements

6.28.3 Constructor & Destructor Documentation

6.28.3.1 MapPainter::MapPainter (QObject * parent = 0)

Constructs a new [MapPainter](#) with a default size of (42,42).

6.28.3.2 MapPainter::MapPainter (Map * m, QObject * parent = 0)

Constructs a new [MapPainter](#) with a default size of (42,42), and loads the [map](#) m.

6.28.4 Member Function Documentation

6.28.4.1 PtCoords MapPainter::cooToPt (CCoords p) const

Converts cells indice to virtual point coordinates

6.28.4.2 PxCoords MapPainter::cooToPxI (CCoords p) const

Convenient function equivalent to [ptToPxI\(cooToPt\(p\)\)](#)

6.28.4.3 bool MapPainter::hasHighlightedCell () const

Returns true if a [cell](#) is highlighted.

See also [highlightedCell](#) and [setHighlightedCell](#).

6.28.4.4 QPoint MapPainter::highlightedCell () const

Returns the integer index of the [cell](#) the is highlighted.

See also [sethighlightedCell](#) and [hasHighlightedCell](#).

6.28.4.5 PtCoords MapPainter::indToPt (int *i*, int *j*) const

Converts to coordinates

6.28.4.6 void MapPainter::mapSizeChanged (QSize) [signal]

This signal is emitted when the total size of the [map](#)'s view change.

It appends mainly during scale change and modification on the [map](#) (resize, angles setting, ...).

6.28.4.7 QPair< bool, bool > MapPainter::move (PxCoords *delta*, QPointF *center*)

Change the center position from the given center and a pixel difference.

The return value indicate if the expected center was valid (regarding x or y coordinate).

See also [setViewCenter](#).

6.28.4.8 void MapPainter::paint (QPainter & *p*)

Draws the map in the QPaintDevice.

See also [render](#).

6.28.4.9 ClCoords MapPainter::ptToCoo (PtCoords *p*) const

Converts virtual point to cell indice

6.28.4.10 PxCoords MapPainter::ptToPxl (PtCoords *p*) const

Converts virtual point to real pixel coordinates

6.28.4.11 CCoords MapPainter::pxlToCoo (PxCoords *p*) const

Convenient function equivalent to [ptToCoo\(pxIToPt\(p\)\)](#)

6.28.4.12 PtCoords MapPainter::pxlToPt (PxCoords *p*) const

Converts real pixel to virtual point coordinates

6.28.4.13 const QImage & MapPainter::render ()

Provides a QImage with a view of the map.

See also [paint](#).

6.28.4.14 void MapPainter::resize (QSize *s*)

Change the size of the view, *ie* the rectangle in which the map will be render.

See also [size](#).

6.28.4.15 void MapPainter::resize (int *wi*, int *he*)

This is an overload function, see [resize](#)

6.28.4.16 double MapPainter::scale () const

Returns the current scale of the view.

See also [setScale](#).

6.28.4.17 bool MapPainter::setHighlightedCell (const CCoords & *p*)

Set the highlighted [cell](#) to the one at the [CCoords](#) *p*

See also [highlightedCell](#) and [hasHighlightedCell](#).

6.28.4.18 bool MapPainter::setHighlightedCell (int *i*, int *j*)

This is an overload function, see [setViewCenter](#).

6.28.4.19 void MapPainter::setMap (Map * *m*)

Loads the [map](#), computing the new size of the view area.

6.28.4.20 void **MapPainter::setPaintedElement** (**MapPainter::Element** *e*, bool *painted = true*)

Enables or disables the render of an [element](#).

See also [setPaintedElements](#).

6.28.4.21 void **MapPainter::setPaintedElements** (**Element** *e*)

Set the rendered [elements](#).

See also [setPaintedElement](#).

6.28.4.22 void **MapPainter::setScale** (double *scale*)

Set the current view scale. This closest value in the scale domain will be used.

See also [scale](#) and [setScaleDomain](#).

6.28.4.23 void **MapPainter::setScaleDomain** (double *scaleMin*, double *scaleMax*)

Set the valid values for the scale.

See also [scale](#) and [setScale](#).

6.28.4.24 void **MapPainter::setViewCenter** (**RICoords** *relativeCenter*)

Change the view center, using relative coordinates.

If the new center is invalid (the view exceed the map area), the closest valid center is used.

See also [viewCenter](#).

6.28.4.25 void **MapPainter::setViewCenter** (double *relativeCenterX*, double *relativeCenterY*)

This is an overload function, see [setViewCenter](#).

6.28.4.26 void **MapPainter::setViewCenterQuiet** (double *x*, double *y*)

does the same as [setViewCenter](#), without emitting the signal `viewCenterChanged` to avoid event loop.

6.28.4.27 QSize MapPainter::size () const

Return the size of the rectangle in which the map is render. This is also the size of the image returned by [render](#).

See also [resize](#).

6.28.4.28 RICoords MapPainter::viewCenter () const

Return the relative coordinates of the current view center.

See also [setViewCenter](#).

6.28.4.29 void MapPainter::viewCenterChanged (QPoint) [signal]

This signal is emitted when the center of the [map](#) change.

It appends mainly during moving on the view and zooming.

6.28.4.30 QSize MapPainter::virtualSize () const

Computes the total size of the image of the map

6.28.4.31 void MapPainter::zoom (double factor, QPointF fixedPoint)

Multiplying the scale of the view by factor, trying to leave the point center at the same position.

Note

It is not always possible to keep this point fixed, in particularity when the view is resulting view would exceed the map region. In that case, the center is adapt to minimise the difference.

The documentation for this class was generated from the following files:

- [src/editor/Game/mappainter.h](#)
- [src/editor/Game/mappainter.cpp](#)

6.29 MapsEditor Class Reference

The [MapsEditor](#) class is the tab offering map editing facilities.

```
#include <mapseditor.h>
```

Public Slots

- void **updateGame** ()

Public Member Functions

- **MapsEditor** (QWidget *parent=0)
- void **setGame** (Game *g)

6.29.1 Detailed Description

The [MapsEditor](#) class is the tab offering map editing facilities.

The documentation for this class was generated from the following files:

- src/editor/GUI/Tabs/mapseditor.h
- src/editor/GUI/Tabs/mapseditor.cpp

6.30 MapsListModel Class Reference

The [MapsListModel](#) class provides a presentation class for the Qt Model-View framework.

```
#include <mapslistmodel.h>
```

Public Slots

- void **update** ()

Public Member Functions

- **MapsListModel** (World *w, QObject *parent=0)
- int **rowCount** (const QModelIndex &parent) const Q_DECL_OVERRIDE
- QVariant **data** (const QModelIndex &index, int role) const Q_DECL_OVERRIDE
- bool **insertRows** (int row, int count, const QModelIndex &parent) Q_DECL_OVERRIDE
- bool **removeRows** (int row, int count, const QModelIndex &parent) Q_DECL_OVERRIDE

6.30.1 Detailed Description

The [MapsListModel](#) class provides a presentation class for the Qt Model-View framework.

The documentation for this class was generated from the following files:

- `src/editor/Game/mapslistmodel.h`
- `src/editor/Game/mapslistmodel.cpp`

6.31 MapViewer Class Reference

The [MapViewer](#) class provides a widget to display and edit a [Map](#) using a [MapPainter](#).

```
#include <mapviewer.h>
```

Public Slots

- `void updateRequest ()`

Signals

- `void viewSizeChanged (QSize)`
- `void selectionChanged ()`

Public Member Functions

- `MapViewer (QWidget *parent=0)`
- `void setMap (Map *m)`
- `void updateMap ()`
- `MapPainter & mapPainter ()`

6.31.1 Detailed Description

The [MapViewer](#) class provides a widget to display and edit a [Map](#) using a [MapPainter](#).

The documentation for this class was generated from the following files:

- `src/editor/GUI/Tabs/mapviewer.h`
- `src/editor/GUI/Tabs/mapviewer.cpp`

6.32 src.client.MapViewer Class Reference

Public Member Functions

- `def __init__`
- `def display`

Public Attributes

- **map**
- **world**
- **cellViews**

The documentation for this class was generated from the following file:

- `src/client.py`

6.33 `src.network.NetworkClient` Class Reference

Inherits Thread.

Public Member Functions

- `def __init__`
- `def run`
- `def send`
- `def sendEvent`
- `def kill`

Public Attributes

- **handle**
- **soc**
- **alive**

The documentation for this class was generated from the following file:

- `src/network.py`

6.34 `src.networkudp.NetworkClient` Class Reference

Inherits Thread.

Public Member Functions

- `def __init__`
- `def run`
- `def send`
- `def sendEvent`
- `def kill`

Public Attributes

- **handle**
- **soc**
- **alive**

The documentation for this class was generated from the following file:

- `src/networkudp.py`

6.35 `src.network.NetworkServer` Class Reference

Inherits Thread.

Public Member Functions

- `def __init__`
- `def waitForClients`
- `def run`
- `def sendOrder`
- `def broadcast`
- `def kill`

Public Attributes

- **handle**
- **soc**
- **alive**
- **co**

The documentation for this class was generated from the following file:

- `src/network.py`

6.36 `src.networkudp.NetworkServer` Class Reference

Inherits Thread.

Public Member Functions

- `def __init__`
- `def waitForClients`
- `def run`
- `def sendOrder`
- `def broadcast`
- `def kill`

Public Attributes

- `handle`
- `soc`
- `alive`
- `addr`

The documentation for this class was generated from the following file:

- `src/networkudp.py`

6.37 NewGame Class Reference

Public Member Functions

- **NewGame** (QWidget *parent=0)
- QString **name** () const
- QString **folder** () const
- bool **createFolder** () const

The documentation for this class was generated from the following files:

- `src/editor/GUI/newgame.h`
- `src/editor/GUI/newgame.cpp`

6.38 Object Class Reference

The [Object](#) class is the base class for every part of games.

```
#include <object.h>
```

Inheritance diagram for Object:

Public Member Functions

- **Object** ([Game](#) *g=nullptr)
- void **init** ([Game](#) *g)
- int **id** () const
- virtual bool **isValid** () const
- const QDateTime & **lastModification** () const
- int **getParam** (const QString &p)
- void **touch** ()

Protected Attributes

- [Game](#) * **game**
- int **id**
- QMap< QString, int > **params**
- QString **fileName**
- QDateTime **lastEdit**

6.38.1 Detailed Description

The [Object](#) class is the base class for every part of games.

Each instance is identified by a game-wide unique identifier.

On each modification, the lastEdit attribute has to be updated, in order that other [objects](#) can see that modifications occurred.

6.38.2 Member Function Documentation

6.38.2.1 void Object::init ([Game](#) * *g*)

initialise the object in case it had been construct with a NULL pointer (array of objects)

6.38.2.2 virtual bool Object::isValid () const [inline, virtual]

return true if the object has been initialised

Reimplemented in [Image](#).

6.38.2.3 const QDateTime& Object::lastModification () const [inline]

return the last time of modification

The documentation for this class was generated from the following files:

- src/editor/Game/[object.h](#)
- src/editor/Game/object.cpp

6.39 src.world.ObjectType Class Reference

Public Member Functions

- def **__init__**
- def **create**

Public Attributes

- **type**

The documentation for this class was generated from the following file:

- src/world.py

6.40 Options Struct Reference

Classe singleton encapsulant la gestion des options permanentes.

```
#include <options.h>
```

Public Member Functions

- template<class T >
T **load** (QString group, QString opt)
- template<class T >
void **save** (QString group, QString opt, T val)
- bool **isAdaptaive** (QString group, QString opt, bool adapt=true)
- void **setAdaptaive** (QString group, QString opt, bool adapt)
- void **reinitialise** ()

Static Public Member Functions

- static [Options](#) & **options** ()

6.40.1 Detailed Description

Classe singleton encapsulant la gestion des options permanentes.

Ajoute à QSettings quelques fonctionnalités :

La possibilité de définir si les options s'adaptent lors de la modification ou non (par exemple, la taille de la fenêtre), voir `isAdaptaive`, `setAdaptaive`

The documentation for this struct was generated from the following files:

- src/editor/GUI/options.h
- src/editor/GUI/options.cpp

6.41 src.orders.Order Class Reference

Public Member Functions

Affiche le rapport

6.43.2.2 `def src.utils.Perf.tic (self)`

À lancer avant la fonction

6.43.2.3 `def src.utils.Perf.toc (self)`

À lancer après la fonction

The documentation for this class was generated from the following file:

- `src/utils.py`

6.44 PtCoords Class Reference

The [PtCoords](#) class describe positions with virtual point coordinates.

```
#include <mappainter.h>
```

Public Member Functions

- **PtCoords** (qreal x, qreal y)
- **PtCoords** (const QPointF &p)

6.44.1 Detailed Description

The [PtCoords](#) class describe positions with virtual point coordinates.

Theses coordinates describe each point relatively to the view. They correspond to a point in the image containing the entire map.

See also [RICoords](#), [CICoords](#) and [PxCoords](#)

The documentation for this class was generated from the following file:

- `src/editor/Game/mappainter.h`

6.45 PxCoords Class Reference

The [PxCoords](#) class describe positions with real pixel coordinates.

```
#include <mappainter.h>
```

Public Member Functions

- **PxCoords** (qreal x, qreal y)
- **PxCoords** (const QPointF &p)
- **PxCoords** (const QPoint &p)
- **PxCoords** (int x, int y)

6.45.1 Detailed Description

The [PxCoords](#) class describe positions with real pixel coordinates.

Theses coordinates describe the pixel position.

See also [RlCoords](#), [ClCoords](#) and [PtCoords](#)

The documentation for this class was generated from the following file:

- `src/editor/Game/mappainter.h`

6.46 RlCoords Class Reference

The [RlCoords](#) class describe positions with relative coordinates.

```
#include <mappainter.h>
```

Public Member Functions

- **RlCoords** (qreal x, qreal y)
- **RlCoords** (const QPointF &p)

6.46.1 Detailed Description

The [RlCoords](#) class describe positions with relative coordinates.

Theses coordinates have values in $[0, 1]$, for every point in the view.

See also [ClCoords](#), [PtCoords](#) and [PxCoords](#)

The documentation for this class was generated from the following file:

- `src/editor/Game/mappainter.h`

6.47 src.server.Server Class Reference

Public Member Functions

- `def __init__`
- `def __del__`
- `def run`
- `def handle`
- `def handleEvent`

Public Attributes

- **net**
- **world**
- **actions**
- **persos**
- **orderDispatcher**
- **events**

The documentation for this class was generated from the following file:

- src/server.py

6.48 src.network.ServerConnection Class Reference

Inherits Thread.

Public Member Functions

- def **__init__**
- def **run**
- def **send**

Public Attributes

- **soc**
- **handle**

The documentation for this class was generated from the following file:

- src/network.py

6.49 src.world.ServerObject Class Reference

Inheritance diagram for src.world.ServerObject:

The documentation for this class was generated from the following file:

- src/world.py

6.50 TabAcces Class Reference

Signals

- void **activated** (int i)

Public Member Functions

- **TabAcces** (int i, const QString &n, const QPixmap &p, QWidget *parent=0)
- void **setActive** (bool a)

The documentation for this class was generated from the following files:

- src/editor/GUI/tabaccses.h
- src/editor/GUI/tabaccses.cpp

6.51 TabBar Class Reference

Public Slots

- void **setCurrentTab** (int t)

Signals

- void **currentTabChanged** (int)

Public Member Functions

- **TabBar** (QWidget *parent=0)
- void **addTabAcces** (const QString &n, const QPixmap &p)
- int **currentTab** () const
- void **setTabsEnabled** (bool e)

The documentation for this class was generated from the following files:

- src/editor/GUI/tabbar.h
- src/editor/GUI/tabbar.cpp

6.52 Welcome Class Reference

Public Member Functions

- **Welcome** (QWidget *parent=0)

The documentation for this class was generated from the following files:

- src/editor/GUI/Tabs/welcome.h
- src/editor/GUI/Tabs/welcome.cpp

6.53 src.world.World Class Reference

Public Member Functions

- def `__init__`

Public Attributes

- **maps**

The documentation for this class was generated from the following file:

- src/world.py

6.54 World Class Reference

The [World](#) class is an [Object](#).

```
#include <game.h>
```

Inheritance diagram for World:

Public Member Functions

- **World** ([Game](#) *g=nullptr)
- **ObjectsMap** (w, m, M, ap,, s) ObjectsMap(w

Public Attributes

- **c**
- **C**
- **ellType**

6.54.1 Detailed Description

The [World](#) class is an [Object](#).

The documentation for this class was generated from the following files:

- `src/editor/Game/game.h`
- `src/editor/Game/game.cpp`

6.55 WorldEditor Class Reference

Public Member Functions

- **WorldEditor** (`QWidget *parent=0`)
- void **setGame** ([Game](#) *g)

The documentation for this class was generated from the following files:

- `src/editor/GUI/Tabs/worldeditor.h`
- `src/editor/GUI/Tabs/worldeditor.cpp`

6.56 XmlHandler Class Reference

Public Member Functions

- **XmlHandler** ([Game](#) *g)
- bool **startElement** (`const QString &`, `const QString &localName`, `const QString &`, `const QDomAttributes &atts`)
- bool **endElement** (`const QString &`, `const QString &localName`, `const QString &`)

The documentation for this class was generated from the following files:

- `src/editor/Game/xmlhandler.h`
- `src/editor/Game/xmlhandler.cpp`

Chapter 7

File Documentation

7.1 src/editor/Game/mappainter.h File Reference

Definition of the class used to render maps.

```
#include "map.h"
```

Classes

- class [RlCoords](#)
The [RlCoords](#) class describe positions with relative coordinates.
- class [ClCoords](#)
The [ClCoords](#) class describe positions with cell coordinates.
- class [PtCoords](#)
The [PtCoords](#) class describe positions with virtual point coordinates.
- class [PxCoords](#)
The [PxCoords](#) class describe positions with real pixel coordinates.
- class [MapPainter](#)
The [MapPainter](#) class that can paint a [Map](#) using a [QPainter](#).

Defines

- #define **MINMAX**(a, x, b) std::min(std::max(a,x),b)

Functions

- [MapPainter::Element operator|](#) ([MapPainter::Element](#) a, [MapPainter::Element](#) b)
The operator | is the flag OR operation.
- [MapPainter::Element operator&](#) ([MapPainter::Element](#) a, [MapPainter::Element](#) b)
The operator & is the flag AND operation.

- `MapPainter::Element operator^ (MapPainter::Element a, MapPainter::Element b)`

The operator ^ is the flag subtraction operation.

7.1.1 Detailed Description

Definition of the class used to render maps. This file defines four types of coordinates : `RICoords`, `CICoords`, `PtCoords` and `PxCoords`. They all inherit from `QPointF`, and give a static type checking for the consistency of the coordinates which are used.

7.1.2 Function Documentation

7.1.2.1 `MapPainter::Element operator^ (MapPainter::Element a, MapPainter::Element b) [inline]`

The operator ^ is the flag subtraction operation.

Warning

This is not a XOR operation, it corresponds to `a&!b`

7.2 `src/editor/Game/object.h` File Reference

This header defines the base class `Object` and `Image`.

```
#include <QtCore> #include <QtGui> #include <assert.h>
```

Classes

- class `Object`
The `Object` class is the base class for every part of games.
- class `Image`
The `Image` class stores an external file in a `QImage`, and gives each image ressources a unique identifier.

Defines

- `#define Editing` `lastEdit = QDateTime::currentDateTime()`
- `#define Getter(name)` `inline int name() const{return params[#name];}`
- `#define ParamDef(name, value)` `params[#name] = value; Editing`
- `#define Param(name, Name)`
- `#define ParamObj(name, Name, pref)`
- `#define ObjectsMapC(name, names, Type, Types, pref, arg)`
- `#define ObjectsMap(pref, ini, Ini, body, sg, pl)` `ObjectsMapC(ini##body##sg, ini##body##pl, Ini##body##sg, Ini##body##pl, pref,ini)`

7.2.1 Detailed Description

This header defines the base class [Object](#) and [Image](#). Blablabla.

7.2.2 Define Documentation

7.2.2.1 `#define Editing` `lastEdit = QDateTime::currentDateTime()`

Facility to notify modifications.

7.2.2.2 `#define Getter(name)` `inline int name() const{ return params[#name]; }`

The macro `Getter` create a getter for the parameter name.

7.2.2.3 `#define ObjectsMap(pref, ini, Ini, body, sg, pl)` `ObjectsMapC(ini##body##sg, ini##body##pl, Ini##body##sg, Ini##body##pl, pref,ini)`

The macro `ObjectsMap` define the methods necessary to manipulate a set of objects

7.2.2.4 `#define ObjectsMapC(name, names, Type, Types, pref, arg)`

Value:

```
void add##Type(Type* arg){pref##Types[arg->ident()] = arg; Editing;} \
void remove##Type(Type* arg){if(pref##Types.contains(arg->ident()))pref##
Types.remove(arg->ident()); Editing;} \
inline Type* name(int id) const{return pref##Types.contains(id) ? pref##
Types[id] : nullptr;} \
inline QList<Type*> names() const{return pref##Types.values();} \
private: \
    QMap<int, Type*> pref##Types; \
public:
```

Internal used only

7.2.2.5 `#define Param(name, Name)`

Value:

```
Getter(name) \
    inline void set##Name(int name##Value){ParamDef(name, name##Value);}
```

The macro `Param` defines the getter and setter functions for an object's parameter.

7.2.2.6 `#define ParamDef(name, value)` `params[#name] = value; Editing`

The macro `ParamDef` is a convenient way to modify a parameter

7.2.2.7 #define ParamObj(*name*, *Name*, *pref*)

Value:

```
Name* name() const{return pref##Name;} \
    void set##Name(Name* name##Obj){pref##Name = name##Obj; \
        ParamDef(name,name##Obj ? name##Obj->ident() : 0);} \
private: \
    Name* pref##Name; \
public:
```

The macro ParamObj defines the getter and setter functions for a member object of an [Object](#).
